- Irreducible representations of $\mathfrak{u}(\mathfrak{m})$.

In what follows, $\mathbb{k}$ is an algebraically closed field of characteristic 2.

In what follows, $\Bbbk$ is an algebraically closed field of characteristic 2.

Restricted Jordan plane

It is the algebra $\mathscr{B}$ of dimension 2^4 presented by generators x_1, x_2 with defining relations

$$x_1^2 = 0, \qquad x_2^2 x_1 = x_1 x_2^2 + x_1 x_2 x_1, \tag{1}$$

$$x_2^4 = 0, \qquad x_1 x_2 x_1 x_2 = x_2 x_1 x_2 x_1. \tag{2}$$

In what follows, $\Bbbk$ is an algebraically closed field of characteristic 2.

Restricted Jordan plane

It is the algebra $\mathscr{B}$ of dimension 2^4 presented by generators x_1, x_2 with defining relations

$$x_1^2 = 0, \qquad x_2^2 x_1 = x_1 x_2^2 + x_1 x_2 x_1, \tag{1}$$

$$x_2^4 = 0, \qquad x_1 x_2 x_1 x_2 = x_2 x_1 x_2 x_1. \tag{2}$$

Bosonization

Let $\Gamma = \langle g \rangle$ be the cyclic group of order 2, written multiplicatively. The bosonization $H := \mathscr{B} \# \Bbbk\Gamma$ is a pointed Hopf algebra of dimension 2^5 generated by x_1, x_2, g with satisfies the previous relations and

$$gx_1 = x_1 g, \qquad gx_2 = x_2 g + x_1 g, \qquad g^2 = 1. \tag{3}$$

The coproduct of H is given by

$$\Delta(g) = g \otimes g, \qquad \Delta(x_i) = x_i \otimes 1 + g \otimes x_i, \quad i \in \mathbb{I}_2.$$

Drinfed double of H

The Drinfeld double of H is $D(H) = H \otimes H^{*\,\mathrm{op}}$ as coalgebra. As algebra, $D(H)$ is generated by $x_1, x_2, g, w_1, w_2, \gamma$ with relations (1),(2), (3) and

Drinfed double of H

The Drinfeld double of H is $D(H) = H \otimes H^{*\,\mathrm{op}}$ as coalgebra. As algebra, $D(H)$ is generated by $x_1, x_2, g, w_1, w_2, \gamma$ with relations (1),(2), (3) and

$$
\begin{aligned}
w_1^2 &= 0, & w_2^2 w_1 &= w_1 w_2^2 + w_1 w_2 w_1, \\
w_2^4 &= 0, & w_1 w_2 w_1 w_2 &= w_2 w_1 w_2 w_1, \\
\gamma^2 &= \gamma, & w_i\gamma &= \gamma w_i + w_i, \\
w_1 x_1 &= x_1 w_1, & w_1 x_2 &= x_2 w_1 + 1 + g, \\
w_1 g &= g w_1, & w_2 x_1 &= x_1(w_1 + w_2) + 1 + g, \\
w_2 g &= g(w_1 + w_2), & \gamma x_i &= x_i \gamma + x_i, \\
w_2 x_2 &= x_2 w + g\gamma,
\end{aligned}
$$

Drinfed double of H

The Drinfeld double of H is $D(H) = H \otimes H^{*\,\mathrm{op}}$ as coalgebra. As algebra, $D(H)$ is generated by $x_1, x_2, g, w_1, w_2, \gamma$ with relations (1),(2), (3) and

$$
\begin{aligned}
w_1^2 &= 0, & w_2^2 w_1 &= w_1 w_2^2 + w_1 w_2 w_1, \\
w_2^4 &= 0, & w_1 w_2 w_1 w_2 &= w_2 w_1 w_2 w_1, \\
\gamma^2 &= \gamma, & w_i \gamma &= \gamma w_i + w_i, \\
w_1 x_1 &= x_1 w_1, & w_1 x_2 &= x_2 w_1 + 1 + g, \\
w_1 g &= g w_1, & w_2 x_1 &= x_1 (w_1 + w_2) + 1 + g, \\
w_2 g &= g(w_1 + w_2), & \gamma x_i &= x_i \gamma + x_i, \\
w_2 x_2 &= x_2 w + g\gamma,
\end{aligned}
$$

We have $\dim D(H) = 2^{10}$.

Fix the following elements in $D(H)$:

$$x_{21} = x_1x_2 + x_2x_1, \qquad w_{21} = w_1w_2 + w_2w_1.$$

Fix the following elements in $D(H)$:

$$x_{21} = x_1 x_2 + x_2 x_1, \qquad w_{21} = w_1 w_2 + w_2 w_1.$$

Central Hopf subalgebra

The subalgebra $\mathbf{T}$ of $D(H)$ generated by x_1, x_{21}, w_1, w_{21} and g is a normal local commutative Hopf subalgebra with defining relations

$$x_1^2 = 0, \qquad x_{21}^2 = 0, \qquad w_1^2 = 0, \qquad w_{21}^2 = 0, \qquad g^2 = 1.$$

Also $\dim \mathbf{T} = 2^5$.

Fix the following elements in $D(H)$:

$$x_{21} = x_1 x_2 + x_2 x_1, \qquad w_{21} = w_1 w_2 + w_2 w_1.$$

Central Hopf subalgebra

The subalgebra $\mathbf{T}$ of $D(H)$ generated by x_1, x_{21}, w_1, w_{21} and g is a normal local commutative Hopf subalgebra with defining relations

$$x_1^2 = 0, \qquad x_{21}^2 = 0, \qquad w_1^2 = 0, \qquad w_{21}^2 = 0, \qquad g^2 = 1.$$

Also $\dim \mathbf{T} = 2^5$.

Hence

$$\mathbf{T} \xrightarrow{\iota} D(H) \xrightarrow{\pi} D(H)/D(H)\mathbf{T}^+$$

is an exact sequence of Hopf algebras.

We fix the following elements of $D(H)/D(H)\mathbf{T}^{+}$:

$$a = \overline{x}_2, \qquad b = \overline{w}_2, \qquad c = \overline{\gamma}.$$

We fix the following elements of $D(H)/D(H)\mathbf{T}^+$:

$$a = \overline{x}_2, \qquad b = \overline{w}_2, \qquad c = \overline{\gamma}.$$

Hopf algebra quotient

The algebra $D(H)/D(H)\mathbf{T}^+$ is generated by a, b, c and satisfies the relations

$$ab + ba = c, \qquad ac + ca = a, \qquad bc + cb = b,$$
$$a^4 = b^4 = 0, \qquad c^2 + c = 0.$$

We fix the following elements of $D(H)/D(H)\mathbf{T}^+$:

$$a = \overline{x}_2, \qquad b = \overline{w}_2, \qquad c = \overline{\gamma}.$$

Hopf algebra quotient

The algebra $D(H)/D(H)\mathbf{T}^+$ is generated by a, b, c and satisfies the relations

$$ab + ba = c, \qquad ac + ca = a, \qquad bc + cb = b,$$
$$a^4 = b^4 = 0, \qquad c^2 + c = 0.$$

The Hopf algebra $D(H)/D(H)\mathbf{T}^+$ is a well-known algebra in modular Lie theory.

Denote by $\mathfrak{s}$ the unique, up to isomorphism, simple Lie algebra of dimension 3, that is, $\mathfrak{s}$ has a basis $\{e, f, h\}$ and bracket

$$[e, f] = h, \qquad [e, h] = e, \qquad [f, h] = f.$$

Denote by $\mathfrak{s}$ the unique, up to isomorphism, simple Lie algebra of dimension 3, that is, $\mathfrak{s}$ has a basis $\{e, f, h\}$ and bracket

$$[e, f] = h, \qquad [e, h] = e, \qquad [f, h] = f.$$

The Lie algebra $\mathfrak{s}$ is not restricted. The minimal 2-envelope of $\mathfrak{s}$ is a 5-dimensional Lie algebra $\mathfrak{m}$.

Denote by $\mathfrak{s}$ the unique, up to isomorphism, simple Lie algebra of dimension 3, that is, $\mathfrak{s}$ has a basis $\{e, f, h\}$ and bracket

$$[e, f] = h, \qquad [e, h] = e, \qquad [f, h] = f.$$

The Lie algebra $\mathfrak{s}$ is not restricted. The minimal 2-envelope of $\mathfrak{s}$ is a 5-dimensional Lie algebra $\mathfrak{m}$.

The algebra $\mathfrak{u}(\mathfrak{m})$

The restricted enveloping algebra $\mathfrak{u}(\mathfrak{m})$ of $\mathfrak{m}$ is isomorphic to $D(H)/D(H)\mathbf{T}^+$ via

$$e \mapsto a, \qquad f \mapsto b, \qquad h \mapsto c.$$

and we have an exact sequence of Hopf algebras

$$\mathbf{T} \overset{\iota}{\hookrightarrow} D(H) \overset{\pi}{\twoheadrightarrow} \mathfrak{u}(\mathfrak{m})$$

Denote by $\mathfrak{s}$ the unique, up to isomorphism, simple Lie algebra of dimension 3, that is, $\mathfrak{s}$ has a basis $\{e, f, h\}$ and bracket

$$[e, f] = h, \qquad [e, h] = e, \qquad [f, h] = f.$$

The Lie algebra $\mathfrak{s}$ is not restricted. The minimal 2-envelope of $\mathfrak{s}$ is a 5-dimensional Lie algebra $\mathfrak{m}$.

The algebra $\mathfrak{u}(\mathfrak{m})$

The restricted enveloping algebra $\mathfrak{u}(\mathfrak{m})$ of $\mathfrak{m}$ is isomorphic to $D(H)/D(H)\mathbf{T}^+$ via

$$e \mapsto a, \qquad f \mapsto b, \qquad h \mapsto c.$$

and we have an exact sequence of Hopf algebras

$$\mathbf{T} \overset{\iota}{\hookrightarrow} D(H) \overset{\pi}{\twoheadrightarrow} \mathfrak{u}(\mathfrak{m})$$

For this reason we are interested in the representations of $\mathfrak{u}(\mathfrak{m})$.

Let V_0, respectively V_1, denote the one-dimensional $\mathfrak{u}(\mathfrak{m})$-module, respectively the three dimensional $\mathfrak{u}(\mathfrak{m})$-module $\mathfrak{s}$ with the adjoint representation ad.

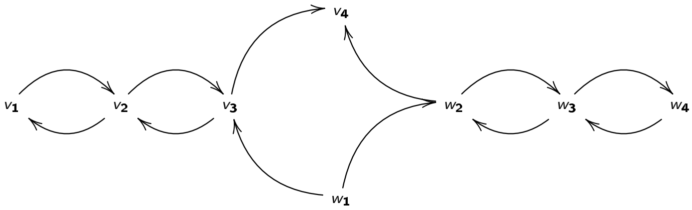
Let V_0, respectively V_1, denote the one-dimensional $\mathfrak{u}(\mathfrak{m})$-module, respectively the three dimensional $\mathfrak{u}(\mathfrak{m})$-module $\mathfrak{s}$ with the adjoint representation ad.

Thus V_1 in the basis $\{v_1, v_2, v_3\} := \{b, c, a\}$ of $\mathfrak{s}$ is given by ad $a = \mathtt{A}$, ad $b = \mathtt{B}$, ad $c = \mathtt{C}$, where

$$\mathtt{A} = \begin{pmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}, \quad \mathtt{B} = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix}, \quad \mathtt{C} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}.$$

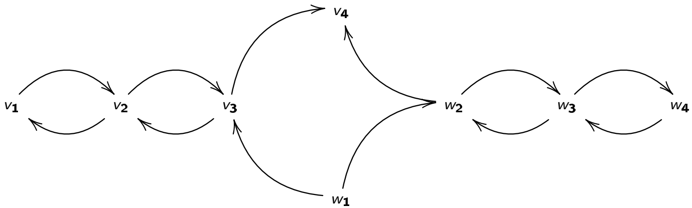
Theorem.
The simple modules of $\mathfrak{u}(\mathfrak{m})$ are V_0 and V_1.

Consider the following 8-dimensional $\mathfrak{u}(\mathfrak{m})$-module M



where the arrows oriented from left to right indicate the action of a while the arrows from right to left are the action of b.

Consider the following 8-dimensional $\mathfrak{u}(\mathfrak{m})$-module M

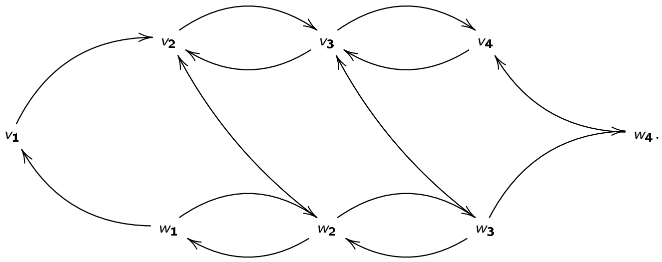


where the arrows oriented from left to right indicate the action of a while the arrows from right to left are the action of b.

Theorem.

- The projective cover of the simple module V_0 is $P(V_0) = M$.
- $P(V_0) \simeq \mathfrak{u}(\mathfrak{m})e_0$, where $e_0 = (1 + ab + a^2b^2)(1 + c)$ is a primitive idempotent of $\mathfrak{u}(\mathfrak{m})$.

Consider the following 8-dimensional $\mathfrak{u}(\mathfrak{m})$-module N



Consider the following 8-dimensional $\mathfrak{u}(\mathfrak{m})$-module N

$$
\begin{tikzcd}
 & v_2 \arrow[r, bend left] \arrow[ddr, <->] & v_3 \arrow[l, bend left] \arrow[r, bend left] \arrow[ddr, <->] & v_4 \arrow[l, bend left] & \\
v_1 \arrow[ur, bend left] & & & & w_4 . \arrow[ul, bend right] \\
 & w_1 \arrow[ul, bend left] \arrow[r, bend left] & w_2 \arrow[l, bend left] \arrow[r, bend left] & w_3 \arrow[l, bend left] \arrow[uur, bend left] &
\end{tikzcd}
$$

Theorem.

- The projective cover of the simple module V_1 is $P(V_1) = N$.
- $P(V_1) \simeq \mathfrak{u}(\mathfrak{m})e_1$, where $e_1 = (1 + a^2b^2)c$ is a primitive idempotent of $\mathfrak{u}(\mathfrak{m})$.

Let $e = e_0 + e_1$ where e_0 and e_1 are the primitive idempotents in $\mathfrak{u}(\mathfrak{m})$ generating the projective covers $P(V_0)$ and $P(V_1)$. Then the basic algebra associated to $\mathfrak{u}(\mathfrak{m})$ is

$$\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} = e\mathfrak{u}(\mathfrak{m})e.$$

Let $e = e_0 + e_1$ where e_0 and e_1 are the primitive idempotents in $\mathfrak{u}(\mathfrak{m})$ generating the projective covers $P(V_0)$ and $P(V_1)$. Then the basic algebra associated to $\mathfrak{u}(\mathfrak{m})$ is

$$\mathfrak{u}(\mathfrak{m})^{\mathrm{b}} = e\mathfrak{u}(\mathfrak{m})e.$$

The basic algebra $\mathfrak{u}(\mathfrak{m})^{\mathrm{b}}$ has a basis

$$\{e_0, e_1, ae_0, a^3e_1, b^3e_0, be_1, a^3b^3e_0, abe_1\}.$$

Let $e = e_0 + e_1$ where e_0 and e_1 are the primitive idempotents in $\mathfrak{u}(\mathfrak{m})$ generating the projective covers $P(V_0)$ and $P(V_1)$. Then the basic algebra associated to $\mathfrak{u}(\mathfrak{m})$ is

$$\mathfrak{u}(\mathfrak{m})^{\mathrm{b}} = e\mathfrak{u}(\mathfrak{m})e.$$

The basic algebra $\mathfrak{u}(\mathfrak{m})^{\mathrm{b}}$ has a basis

$$\{e_0, e_1, ae_0, a^3e_1, b^3e_0, be_1, a^3b^3e_0, abe_1\}.$$

The ordinary quiver of $\mathfrak{u}(\mathfrak{m})^{\mathrm{b}}$, denoted by $Q := Q_{\mathfrak{u}(\mathfrak{m})^{\mathrm{b}}}$, is

$$\begin{tikzcd} 1 \arrow[rr, bend left=50, "\alpha_1"] \arrow[rr, bend left=20, "\alpha_2"] & & 2. \arrow[ll, bend left=20, "\beta_1"] \arrow[ll, bend left=50, "\beta_2"] \end{tikzcd}$$

Theorem.

We have that $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \simeq \Bbbk Q/I$, where

$$I = \langle \alpha_1\beta_1, \alpha_2\beta_2, \beta_1\alpha_1, \beta_2\alpha_2, \alpha_1\beta_2 + \alpha_2\beta_1, \beta_1\alpha_2 + \beta_2\alpha_1 \rangle$$

is the kernel of the algebra epimorphism $\varphi : \Bbbk Q \to \mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ defined by

$$\varphi(\alpha_1) = a^3 e_1, \quad \varphi(\alpha_2) = be_1, \quad \varphi(\beta_1) = ae_0, \quad \varphi(\beta_2) = b^3 e_0,$$

and $\varphi(\varepsilon_i) = e_i$.

Theorem.

We have that $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \simeq \Bbbk Q/I$, where

$$I = \langle \alpha_1\beta_1, \alpha_2\beta_2, \beta_1\alpha_1, \beta_2\alpha_2, \alpha_1\beta_2 + \alpha_2\beta_1, \beta_1\alpha_2 + \beta_2\alpha_1 \rangle$$

is the kernel of the algebra epimorphism $\varphi : \Bbbk Q \to \mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ defined by

$$\varphi(\alpha_1) = a^3 e_1, \quad \varphi(\alpha_2) = b e_1, \quad \varphi(\beta_1) = a e_0, \quad \varphi(\beta_2) = b^3 e_0,$$

and $\varphi(\varepsilon_i) = e_i$.

Corollary

$\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ is a special biserial algebra. Particularly, $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ is tame representation type.

Theorem.

We have that $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \simeq \Bbbk Q/I$, where

$$I = \langle \alpha_1\beta_1, \alpha_2\beta_2, \beta_1\alpha_1, \beta_2\alpha_2, \alpha_1\beta_2 + \alpha_2\beta_1, \beta_1\alpha_2 + \beta_2\alpha_1 \rangle$$

is the kernel of the algebra epimorphism $\varphi : \Bbbk Q \to \mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ defined by

$$\varphi(\alpha_1) = a^3 e_1, \quad \varphi(\alpha_2) = be_1, \quad \varphi(\beta_1) = ae_0, \quad \varphi(\beta_2) = b^3 e_0,$$

and $\varphi(\varepsilon_i) = e_i$.

Corollary

$\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ is a special biserial algebra. Particularly, $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ is tame representation type.

Corollary

Since $\mathfrak{u}(\mathfrak{m})$ is Morita equivalent to $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ it follows that $\mathfrak{u}(\mathfrak{m})$ is tame representation type.

$\rightsquigarrow$ The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].

- The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].
- They are either string modules or band modules.

- The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].
- They are either string modules or band modules.
- Determining strings and bands in $\Bbbk Q/I$ is a combinatorial problem.

- The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].
- They are either string modules or band modules.
- Determining strings and bands in $\mathbb{k}Q/I$ is a combinatorial problem.

In our case, for instance, consider words in the vocabulary $\{\alpha_i^{\pm 1}, \beta_i^{\pm 1} \,:\, i = 1, 2\}$.

- The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].

- Determining strings and bands in $\Bbbk Q/I$ is a combinatorial problem.

In our case, for instance, consider words in the vocabulary $\{\alpha_i^{\pm 1}, \beta_i^{\pm 1} \,:\, i = 1, 2\}$.

The words $a = \alpha_1\alpha_1^{-1}\alpha_2$ and $b = \alpha_1\beta_2$ are not string. In fact, a is not a string because $\alpha_1\alpha_1^{-1}$ is a “piece" of a and b is not a string because $\alpha_1\beta_2$ is a monomial of the binomial relation $\alpha_1\beta_2 + \alpha_2\beta_1$.

- The classification of all indecomposable modules of a special biserial algebra was given in [4, Proposition 2.3].
- They are either string modules or band modules.
- Determining strings and bands in $\Bbbk Q/I$ is a combinatorial problem.

In our case, for instance, consider words in the vocabulary $\{\alpha_i^{\pm 1}, \beta_i^{\pm 1} \ : \ i = 1, 2\}$.

The words $a = \alpha_1\alpha_1^{-1}\alpha_2$ and $b = \alpha_1\beta_2$ are not string. In fact, a is not a string because $\alpha_1\alpha_1^{-1}$ is a "piece" of a and b is not a string because $\alpha_1\beta_2$ is a monomial of the binomial relation $\alpha_1\beta_2 + \alpha_2\beta_1$.

The words $s = \alpha_1\alpha_2^{-1}\alpha_1$ and $t = \beta_1^{-1}\beta_2$ are examples of strings.

String

Consider the words $s_1 = \alpha_1\alpha_2^{-1}$, $s_2 = \alpha_1^{-1}\alpha_2$, $s_3 = \beta_1\beta_2^{-1}$ and $s_4 = \beta_1^{-1}\beta_2$ and r an integer. The families of string in Q are the following:

$$\begin{array}{lll} w_1(r) = s_1^r, & w_2(r) = s_2^r, & r \geq 1, \\ w_3(r) = s_3^r, & w_4(r) = s_4^r, & r \geq 1, \\ w_5(r) = s_1^r\alpha_1, & w_6(r) = (s_1^{-1})^r\alpha_2, & r \geq 0 \\ w_7(r) = s_3^r\beta_1, & w_8(r) = (s_3^{-1})^r\beta_2, & r \geq 0. \end{array}$$

String

Consider the words $s_1 = \alpha_1\alpha_2^{-1}$, $s_2 = \alpha_1^{-1}\alpha_2$, $s_3 = \beta_1\beta_2^{-1}$ and $s_4 = \beta_1^{-1}\beta_2$ and r an integer. The families of string in Q are the following:

$$\begin{array}{lll} w_1(r) = s_1^r, & w_2(r) = s_2^r, & r \geq 1, \\ w_3(r) = s_3^r, & w_4(r) = s_4^r, & r \geq 1, \\ w_5(r) = s_1^r\alpha_1, & w_6(r) = (s_1^{-1})^r\alpha_2, & r \geq 0 \\ w_7(r) = s_3^r\beta_1, & w_8(r) = (s_3^{-1})^r\beta_2, & r \geq 0. \end{array}$$

Similarly, we have the notion of band. For our case, there are 2 families of band in Q.

In order to illustrate how to associate an indecomposable module to a string, we consider the string $w_1(1) = s_1 = \alpha_1\alpha_2^{-1}$:

$$1 \xrightarrow{\alpha_1} 2 \xleftarrow{\alpha_2} 1$$

In order to illustrate how to associate an indecomposable module to a string, we consider the string $w_1(1) = s_1 = \alpha_1\alpha_2^{-1}$:

$$1 \xrightarrow{\alpha_1} 2 \xleftarrow{\alpha_2} 1$$

The right $\Bbbk Q/I$-module $U(w_1(1)) := \Bbbk\{w_1, w_2, w_3\}$ (a vector for each vertex) is given by:

$$\begin{array}{llll} u_1 \cdot \epsilon_1 = u_1, & u_1 \cdot \epsilon_2 = 0, & u_1 \cdot \alpha_1 = u_2, & u_1 \cdot \alpha_2 = 0, \\ u_2 \cdot \epsilon_1 = 0, & u_2 \cdot \epsilon_2 = u_2, & u_2 \cdot \alpha_1 = 0, & u_2 \cdot \alpha_2 = 0, \\ u_3 \cdot \epsilon_1 = u_3, & u_3 \cdot \epsilon_2 = 0, & u_3 \cdot \alpha_1 = 0, & u_3 \cdot \alpha_2 = u_2, \end{array}$$

The algebra isomorphism $\mathfrak{u}(\mathfrak{m})^{\flat} \simeq \Bbbk Q/I$ and an anti-isomorphism of Hopf algebras $\mathfrak{u}(\mathfrak{m})^{\flat} \to \mathfrak{u}(\mathfrak{m})^{\flat}$ induce on $U(w_1(1))$ a left $\mathfrak{u}(\mathfrak{m})^{\flat}$-module structure via

The algebra isomorphism $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \simeq \Bbbk Q/I$ and an anti-isomorphism of Hopf algebras $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \to \mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ induce on $U(w_1(1))$ a left $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$-module structure via

$$\begin{array}{llll} e_1 \cdot u_1 = u_1, & e_2 \cdot u_1 = 0, & ae_1 \cdot u_1 = u_2, & b^3 e_1 \cdot eu_1 = 0, \\ e_1 \cdot u_2 = 0, & e_2 \cdot u_2 = u_2, & ae_1 \cdot u_2 = 0, & b^3 e_1 \cdot u_2 = 0, \\ e_1 \cdot u_3 = u_3, & e_2 \cdot u_3 = 0, & ae_1 \cdot u_3 = 0, & b^3 e_1 \cdot u_3 = u_2. \end{array}$$

The algebra isomorphism $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \simeq \Bbbk Q/I$ and an anti-isomorphism of Hopf algebras $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}} \to \mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ induce on $U(w_1(1))$ a left $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$-module structure via

$$
\begin{array}{llll}
e_1 \cdot u_1 = u_1, & e_2 \cdot u_1 = 0, & ae_1 \cdot u_1 = u_2, & b^3 e_1 \cdot eu_1 = 0, \\
e_1 \cdot u_2 = 0, & e_2 \cdot u_2 = u_2, & ae_1 \cdot u_2 = 0, & b^3 e_1 \cdot u_2 = 0, \\
e_1 \cdot u_3 = u_3, & e_2 \cdot u_3 = 0, & ae_1 \cdot u_3 = 0, & b^3 e_1 \cdot u_3 = u_2.
\end{array}
$$

The other elements of the basis of $\mathfrak{u}(\mathfrak{m})^{\mathfrak{b}}$ act trivially.

The functors

$$\begin{aligned} \mathrm{Ind}_e &: = {}_{\mathfrak{u}(\mathfrak{m})^{\flat}}\mathcal{M} \to {}_{\mathfrak{u}(\mathfrak{m})}\mathcal{M}, \qquad \mathrm{Ind}_e(N) = \mathfrak{u}(\mathfrak{m})e \otimes_{\mathfrak{u}(\mathfrak{m})^{\flat}} N, \\ \mathrm{Res}_e &: = {}_{\mathfrak{u}(\mathfrak{m})}\mathcal{M} \to {}_{\mathfrak{u}(\mathfrak{m})^{\flat}}\mathcal{M}, \qquad \mathrm{Res}_e(M) = eM \end{aligned}$$

are inverse equivalences of categories.

The functors

$$\begin{aligned} \mathrm{Ind}_e &: ={}_{\mathfrak{u}(\mathfrak{m})^\flat}\mathcal{M} \to {}_{\mathfrak{u}(\mathfrak{m})}\mathcal{M}, & \mathrm{Ind}_e(N) &= \mathfrak{u}(\mathfrak{m})e \otimes_{\mathfrak{u}(\mathfrak{m})^\flat} N, \\ \mathrm{Res}_e &: ={}_{\mathfrak{u}(\mathfrak{m})}\mathcal{M} \to {}_{\mathfrak{u}(\mathfrak{m})^\flat}\mathcal{M}, & \mathrm{Res}_e(M) &= eM \end{aligned}$$

are inverse equivalences of categories.

Thus $\mathrm{Ind}_e\,(U(w_1(1)))$ is the following 5-dimensional left $\mathfrak{u}(\mathfrak{m})$-module

$$\begin{tikzcd} e_1 \otimes u_1 \arrow[r, bend left] & e_2 \otimes u_2 \arrow[r, bend left] & ae_2 \otimes u_2 \arrow[r, bend left] \arrow[l, bend left] & a^2 e_2 \otimes u_2 \arrow[l, bend left] & e_1 \otimes u_3 \arrow[l, bend left] \end{tikzcd},$$

where the arrows oriented from left to right indicate the action of a while the arrows from right to left are the action of b.

Category of finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules

The non-isomorphic finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules are:

$\rightsquigarrow$ the 8 families of string modules,

Category of finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules

The non-isomorphic finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules are:

- the 8 families of string modules,
- the 2 families of band modules,

Category of finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules

The non-isomorphic finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules are:

- the 8 families of string modules,
- the 2 families of band modules,
- the 2 simple modules and its respective projective covers.

Category of finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules

The non-isomorphic finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules are:

- the 8 families of string modules,
- the 2 families of band modules,
- the 2 simple modules and its respective projective covers.

Next step

Determine the fusion rules. Precisely, for all finite-dimensional indecomposable left $\mathfrak{u}(\mathfrak{m})$-modules U and V, calculate the decomposition of $U \otimes_{\mathbb{k}} V$ in direct sum of indecomposable modules.
